

See How it Works!

Treated

On treated carpet, the orange juice beads up, and can be blotted up without a trace.

Untreated

The orange juice soaks into untreated carpet and makes a spot that's hard to get out.

Stains Won't Stick to Teflon®

Teflon® Advanced delivers its protection by forming a molecular shield around each carpet fiber. The shield lowers the surface energy of the carpet fibers causing them to repel liquid spills and dust and dirt. This helps prevent dirt and stains from being ground into or absorbed by the fibers.

Undetectable by sight, smell or touch, Teflon® Advanced protects all kinds of carpets. The repellent characteristic of Teflon® Advanced keeps dirt from sticking to the fibers, making carpets easier to care for. This helps your carpets look cleaner and fresher longer.

It's Easy to See How Teflon® Advanced Repels Dirt and Spills

Frequently Asked Questions

Does Cleaning Remove the Teflon®?

Some Teflon® Advanced Carpet Protector is removed from the fiber from heavy traffic or aggressive cleaning. Some product may also be removed by strong cleaning agents and chemicals. Check with your supplier to determine which cleaning agents you may need to avoid. It is generally recommended to re-apply Teflon® Advanced each time the carpet is cleaned.

What is the difference between the mill applied and after market products?

The mill applied products are formulated for drying in the high temperature ovens found in carpet mills, while the home applied products are formulated to dry at ambient temperatures. Because the mill applied products are "baked on", they are typically more durable, depending

upon the product. However, Teflon® Advanced has good durability and provides valuable protection against soil and stains.

How often should protectors be applied?

Since the biggest enemy of the protectors is abrasion from traffic, and traffic varies with each situation, the general recommendation for re-application is after each cleaning. The same conditions that led to the need for cleaning probably have led to the need to refresh the carpet protection.

Is Teflon® appropriate for all fibers?

Yes, Teflon® Advanced provides protection from soil and stains on all types of carpet fibers. A special formulation of Teflon® Advanced carpet protector has now been developed for use on wool fibers.

Should Teflon® Advanced be raked in?

Yes. After being sprayed on, the best way to assure even distribution and penetration into the pile is to groom or rake the carpet.

What about drying time?

Whenever possible the carpet should not be put back into service until dry to the touch. The length of time will vary depending upon the drying conditions, but is usually only a few hours.

Why apply Teflon® Advanced?

First, because Teflon® Advanced Carpet Protector provides a valuable service for your customers - it keeps the carpet looking good longer. From a business perspective, Teflon® Advanced will improve customer satisfaction increase profitability on the job. Two very important reasons!

Can Teflon® Advanced be applied to upholstery?

Yes, Teflon® Advanced also works on upholstery that is not subject to water damage as is silk and other more exotic fabrics. Teflon® Advanced is suitable to protect upholstery made from most cotton, nylon, polyester, and blends of these fibers. But if water damage is a possibility or a concern, do not apply Teflon® Advanced.
